WHO WE ARE

Turbo India Interconnect Solutions (TICS) – subsidiary of Turbo India, is an AS9100 certified company, specialized in manufacture and supply of Connectors, Backshells, Protective Covers, Electrical Contacts and Components for Military, Aerospace and Industrial applications, against standard and custom requirements.

Headquartered in Bangalore, India, the 4000sq.m. facility is equipped with adequate infrastructure for the design, manufacture, assembly, testing and inspection of interconnect products.

The long-standing manufacturing expertise of the Turbo group, spanning over two decades since 1996, supporting the Military and Aerospace industry, equips TICS to work in collaboration with its customers to offer a complete solution.

VISION

To be a trusted and reliable hub for on-time, best in-class quality solutions for the interconnect requirements of Military, Aerospace, Industrial, Railways, Marine, Oil & Gas, and Medical sectors.

MISSION

The TICS family will continuously strive towards delighting the customers with on-time quality solutions, by utilizing world class facilities, following industry best practices, adopting a never-ending exercise of continuous improvement and employee engagement.

CAPABILITIES

SALES – With sales and distribution networks in India, Europe & the USA, we are ever closer to our customers. Our sales team is capable of understanding your needs and expectations and is focused in delivering the right solution and the best customer experience.

ENGINEERING – Our dedicated engineering team, equipped and aided with adequate product knowledge and software technologies are capable of providing standard or bespoke interconnect solutions, by working in partnership with you for specific designs to best suit your needs.

PRODUCTION – Our fleet of high-end CNC machines, aided by decades of experience are capable of manufacturing complex geometries. With machining, surface plating and assembly facilities under one roof, we assure highest quality in quick turn-around time.

COST AND LEAD TIME – Through constantly reviewing our manufacturing process and implementing continual improvement practices, we always aim to pass on the benefits of cost and lead time to our customers.

BACKSHELLS DESIGN

Connector backsheets are need based accessories attached to the rear side of connector. Apart from the primary function of protecting the cable-contact interface from external interferences, backsheets may also be designed to serve additional requirements like strain relief, environmental sealing and EMI/RFI shielding between the connected cable and the connector.

Connector backsheets come in various shapes and sizes – the front end essentially designed to suite and attach to the rear side of the particular connector they are intended to serve, and the rear end designed to serve the intended backshell function. The attaching mechanism on the connector end for circular backsheets will be by thread coupling.

Depending on the intended function, the backsheets for a particular connector vary with respect to their configuration like, an O-ring provided for sealing between connector and backshell coupler for environmental sealing, clamps to secure cable/ wire bunch for strain relief, holding area for securing cable/ external braid for EMI/RFI shielding, provision for accommodating a heat shrink boot etc.

SELECTION PROCEDURE

The backshells on offer from Turbo India Interconnect Solutions (TI) are identified by specific characters in its ordering part number to suite multiple requirements for the customer in terms of Fit, Form & Function. A general selection procedure given below may be used as a reference to identify your ordering part number on your own, even when our team is always available to handle this activity for you.

1. IDENTIFY THE PRODUCT SERIES

At TI, the connector backshells are identified by the backshell type with respect to different cable terminations intended for functions like EMI/ RFI shielding, strain relief etc. or a combination, defined by '**PRODUCT SERIES**' in the ordering information.

TI offers its '**shielding backshells**' with different provisions for accommodating the shielding braid either integrated on the connecting cable or independent. These backshells are intended and designed to effectively extend the protection over the signal transfer interface of the connector, against external signal interferences, offered by the attaching braided cable or provide for the same by attachment of an external braid. Provision is available for attaching a shrink boot as well to protect the braid – backshell connection against ingress. The TB160 series even offers a strain relief option as well. Different termination options for the braid on to the backshell is illustrated in the '**BRAID TERMINATIONS**' page (16).

TI '**strain relief backshells**' are designed to hold the strain on the cable due to external forces, from reaching the contact – cable interface by limiting the pull on the cable, by means of cable clamps and a suiting profile on the rear of the backshells. The resistance levels to the straining forces for different shell sizes and cable sizes are based on the SAE-AS85049 standard.

TI '**shrink boot adaptor backshells**' are offered to provide a sealing option between the attaching cable and the backshell. The backshell adaptors are not meant for EMI/RFI shielding functions. The shrink boot selection is kept open for the customer and not supplied along with the backshell.

Apart from the above, TI also offers ‘backnut adaptors’ which offers only the basic function of protecting the cable connector interface and does not provide shielding, shrink boot provision or strain relief. Never the less, the user may choose to add a boot over the backshell coupling nut for any sealing. The TI product series for the backshell can be identified by the reference information given in ‘**PRODUCT FINDER**’ page (**11**)

2. IDENTIFY THE CONNECTOR INTERFACE

Usability of any backshell is governed by the connector interface on to which the backshell is supposed be coupled. TICS identifies the connector interface with the letter following the Series name, in its ordering information.

TI backshells are either designed for use against popular standard connector interfaces as defined in the SAE-AS85049 standard, or made to suite non-standard connector interfaces like MIL-DTL-26482 Series-1 and MIL-DTL-5015 solder, with specific thread specifications defined for the connector. The available TI backshell interfaces are mentioned in ‘**CONNECTOR INTERFACE DATA**’ page (**13**).

3. SELECT A SUITABLE COUPLING OPTION

The backshell coupled to any connector should be robust enough to withstand severe mechanical loading conditions like high continuous vibrations, which may cause unintended uncoupling - leading to the loss of primary function like shielding/ contact- cable protection or strain relief. Use of backshells with **self-locking** option will avoid this to a large scale. TI backshells with self-locking options are designed to provide audible detented self-locking and to withstand the requirements of the SAE-AS85049 standard.

For application environments encountering NIL or intermittent minor vibrations, the User may select a backshell with the free-spinning coupling option. To improve on the safety factor for the free-spinning versions, the User is also offered an option of selecting a **free-spinning backshell** with safety-wire-holes on the coupling nut. Safety wire holes may be used to secure the coupled backshell with an external wire, against un-intended uncoupling.

Apart from self-locking and free-spinning backshells which adopts a multi-part coupling nut - locking adaptor design, certain TI backshell series are offered with single part **direct coupled adaptor**, without a coupling nut. The option to select different coupling styles available at TI, is provided in the specific ordering information matrix for different backshell series.

4. SELECT A SUITABLE BACKSHELL ANGLE

TI offers selection of straight as well as angled profiles in its backshells for effective cable management. The offered angles are generally **45°** and **90°** for select backshell series, but customized options may also be offered. The selection of backshells should be based on the available room for cable routing, accessibility for repair or rework, and to avoid over-straining due to acute angles.

5. SPECIFY BASE MATERIAL AND FINISH

The material and finish selection of a backshell should be same as the connector material and finish. This ensures satisfying conductivity requirements on a grounding backshells apart from avoiding galvanic corrosion due to dissimilar metal contact.

TI offers its backshells in aluminium alloy, with a surface plating of cadmium, electroless nickel, zinc nickel and zinc cobalt. All SAE-AS85049 equivalents satisfy the salt spray requirements of the standard. In addition, backshells are also offered in passivated stainless steel and nickel-aluminium bronze.

Options to select the desired material and finish for TI backshells are specified in the ordering information matrix, specific to different backshell series.

6. SELECT SHELL SIZE, CABLE ENTRY & BACKSHELL LENGTH

TI backshell shell sizes are defined corresponding to the connector shell size. The design and construction of standard offerings are made based on SAE-AS85049.

Customized variants with regard to cable entry and length are also offered, and the available options are defined specific to the backshell series and identified in the backshell part number.

Cable entry defines the size of the jacketed cable or the cable bundle that may be routed through the backshell, to be terminated to the connector. Selection should be in such a way that the cable / cable bundle diameters are taken in smoothly without tightening on the cable, while avoiding a clearance slack of more than 1mm radially. TI offers the standard cable entry sizes based on SAE-AS85049 standard and an addition of customized ranges, defined as in the ordering information matrix.

Standard TI backshell are offered satisfying the length requirements of SAE-AS85049 and in increments of half inch defined for specific backshells in corresponding ordering information matrix. The extend of availability for increments in length may be confirmed by the User, with TI sales, during enquiry/ before placing orders.

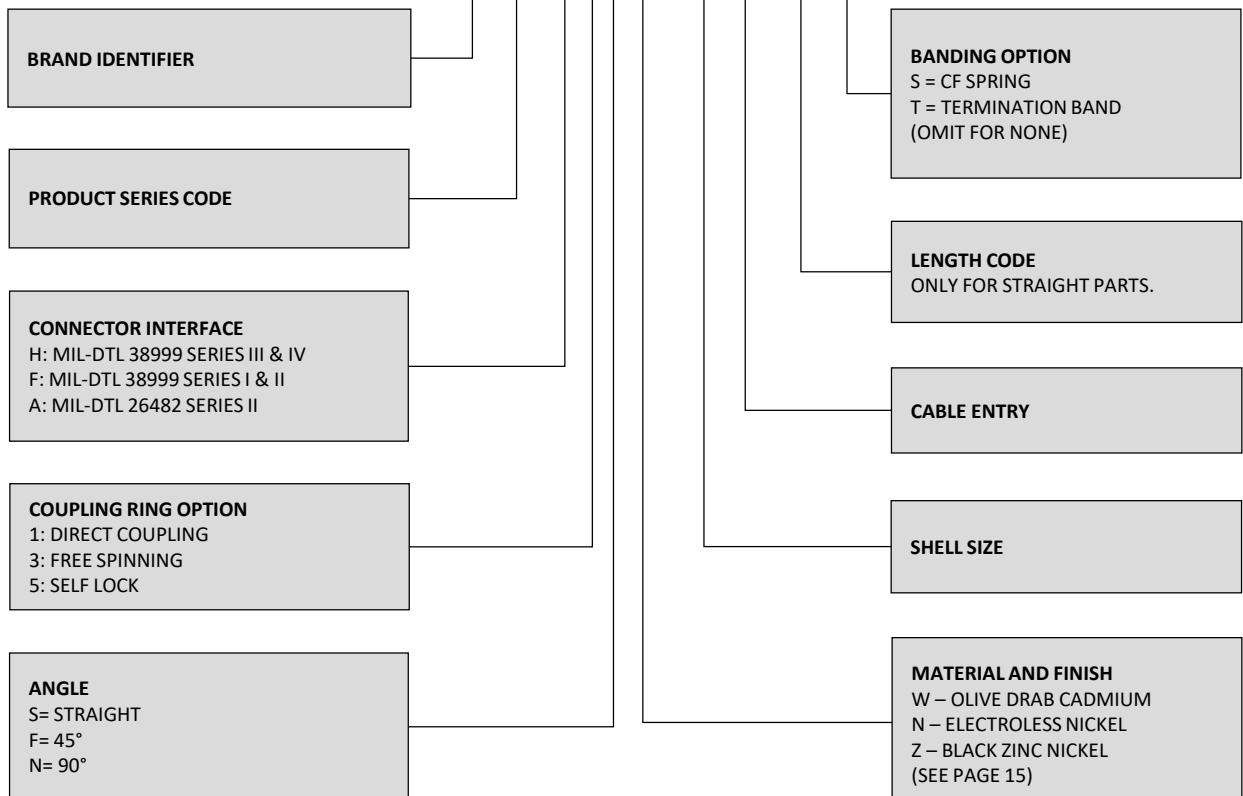

7. SELECT/ SPECIFY SPECIAL REQUIREMENTS

TI backshell part numbers provide an option for listing additional special features required by the User, either developed and part of standard offerings as defined in specific ordering information matrix for the backshell series, or proposed by User and mutually agreed upon.

The backshell selection steps listed above in most cases, will help customers in choosing a TI part number satisfying the User requirements, from the standard offerings. Alternatively, the requirements may be floated or an equivalent SAE-AS85049/ competitor part number shared, to the TI team who may suggest a suitable backshell part number for quote/ procurement.

COUPLING RING OPTIONS

DIRECT COUPLING (1)

The coupling nut is eliminated in this design, and the backshell directly threads to the connector.

FREE SPINNING (3)

Free Spinning Adapters makes the assembly of the backshell to the connector easy without turning the entire backshell body. The coupling nut is free to rotate in this design.

SELF LOCK – DETENT (5)

The movement of coupling nut is locked by means of an anti decoupling device in this design. The Self Lock adapters are the most popular among the many backshell adapter variants.

CIRCULAR BACKSHELLS

TI offers a comprehensive range of circular backshells ideal for use in rugged and harsh environment applications. All the backshells manufactured at our facility are compatible with applicable military specifications or commercial equivalents.

Backshells can selected based on wide variety of termination options including the Banding, Shield Sock, Memory Ring, Band In a Can and Cable Clamp Strain Reliefs.

With a range of materials & finishes, coupling ring styles and cable entry configurations, TI offers a one stop solution for protecting your military connectors.

TERMINATION ACCESSORIES

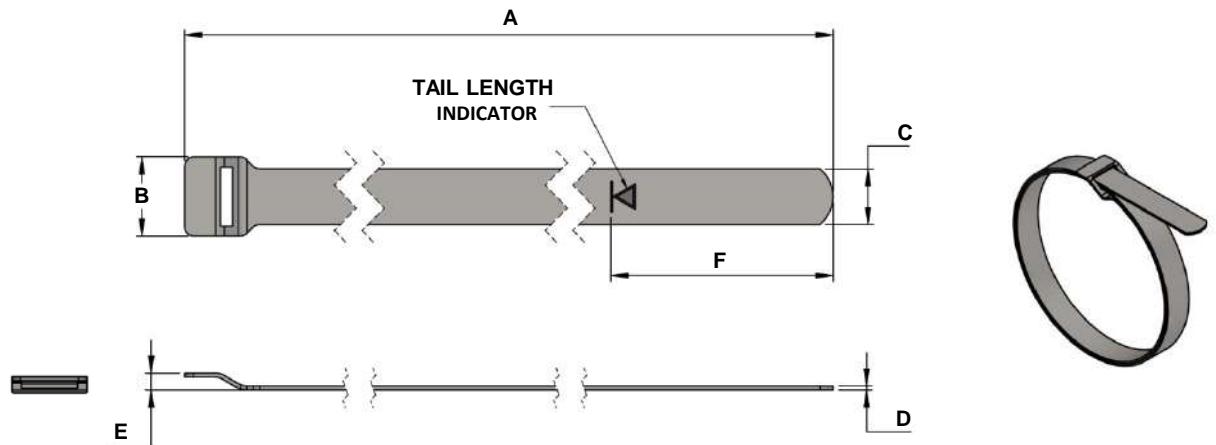

Termination accessories are nothing but, elements which we used for terminating EMI/RFI braids to backshell. There is lot of methods for it like Band Termination, Spring Termination, Memory ring Termination etc.

You can choose your termination accessory for your backshell from this catalogue and integrate in respective product part numbering code to avail the elements in your backshell kit.

SERIES SB

STAINLESS STEEL SPRING BAND OPTION

- Re-usable and self tensioning to secure both overall and individual braid termination.
- Easy to install - requires no tooling while providing a high level of tensile strength to the assembly.
- Suitable for corrosive environments and are not affected by vibration, shock or extreme temperatures.

Use **TI Order Code 'S'** to have a constant force spring band included with the adapter. We will determine the appropriate size needed based on the Cable Entry called out on the Part Number.

Turbo India Interconnect Solutions(TICS), built on the foundations of a 25 plus year interconnect components manufacturing legacy of Turbo India, is where you can find a complete solution for your interconnect needs. We strive for “CUSTOMER DELIGHT” through strict adherence to Customer and Product requirements and by maintaining an open-door for customizations.

For enquiries, the customer may either propose a suitable part number, based on the ordering information provided, or the TI Sales & Engineering Teams can assist in choosing the best possible configuration, based on applications, from the standard solutions available or propose a custom solution with part numbers and lead times, at the earliest.

For supply of standard solutions referred to in this catalog, an order may be placed after generating the required part numbers from the ordering information page.

For any orders or enquiries you may mail us on sales@turboindia.co.in
